Abstracts

The robot servo wheel module is a moving component that integrates a servo motor, a drive wheel, and a control system. It is mainly used in the robot's mobile system. It controls the speed and direction of the drive wheel through the servo motor to achieve smooth and precise movement of the robot. Unlike traditional electric drive methods, servo motors can provide higher precision and response speed, so servo wheel modules are often used in robot applications that require precise motion control, such as automated handling, inspection robots, service robots, etc. By cooperating with other sensors and control systems, the servo wheel module can complete more complex tasks, such as precise path tracking, rotation and translation. The advantages of this module are high-precision control, integrated design, and efficient power transmission.

The global Robot Servo Wheel Module market size was estimated at USD 71.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.10% during the forecast period.
