Robot Tractor/Autonomous tractor is a revolutionary technology in the field of agricultural automation, combining autonomous driving, artificial intelligence, Internet of Things and precision agriculture technology, aiming to improve agricultural production efficiency, reduce costs and solve labor shortages. Market trends of robot tractors: More intelligent: Intelligence has become an inevitable trend in the development of farm robots in the future. In the application of new agricultural production models and new technologies, robot tractors, as a new generation of intelligent agricultural machinery, must conduct more in-depth research on visual and non-visual sensor technologies, image acquisition and processing algorithms, etc., so as to improve their recognition and obstacle avoidance capabilities, reduce damage rates, and truly replace humans to achieve intelligent, efficient and precise operations. There are still many challenges under the trend of intelligent and autonomous tractors, including technology, cost, farmer acceptance, and the degree of agricultural digitalization.

1. Technical reliability is the first priority: complex farmland environments place extremely high demands on perception systems. Dynamic obstacles, extreme weather, and crop occlusions can easily lead to sensor misjudgment, as well as adaptability risks of mechanical systems in muddy and steep slopes.
2. High cost: Autonomous tractors need to be equipped with hardware such as laser radar and high-precision GPS systems. The initial investment is relatively high compared to diesel tractors, and the payback period is long.
3. Farmer acceptance: Farmers in different regions will have differences in equipment cognition and concerns about the existence of intelligent tractor system failures.
4. The degree of agricultural digitalization: At present, developed countries and developing countries are polarized. The United States and Europe have established relatively complete digital agricultural systems, while India, Africa and other regions are still dominated by manpower and small machinery. Agricultural efficiency in regions with low digitalization levels is slowly improving, and the technology monopoly of developed countries may

further squeeze the living space of small farmers.
