Report Overview

Robotic hybrid underwater glider is a new type of underwater glider that improves navigational positioning accuracy and maneuverability by adding fin rudder and propeller propulsion system, which makes up for the deficiency of underwater glider to a certain extent. Underwater glider is a new type of underwater robot driven by buoyancy, with low energy consumption and low noise. The cost is low, it meets the needs of long-term and large-scale ocean exploration, and it also has important military application value. However, because the underwater glider also has a low sailing speed and a complex marine environment, it is vulnerable to the influence of wind, waves and currents, and its track and positioning accuracy are low.

This report provides a deep insight into the global Robotic Hybrid Underwater Gliders market covering all its essential aspects. This ranges from a macro overview of the market to micro details of the market size, competitive landscape, development trend, niche market, key market drivers and challenges, SWOT analysis, value chain analysis, etc.
