Report Overview

A robot's end of arm tool (EOAT) is selected based on the operation it will perform and is specific to the part or tool that it manipulates. Robot users often need customized solutions to engage uniquely shaped objects but this is typically a costly and time-consuming approach.

End of arm tooling are devices by which a robot interrelates with other machines around it, conducting, clutching, and operating on various parts. An end-effector is one of the prime parts and an important component of the robotic system. Advent of technology has led to improvement in end-effector to execute different set of tasks according to the program. Robots with multiple arms comprise multiple end-effectors.
