Abstracts

Rochon crystal polarizer is an optical element, which is a polarization device made by using the birefringence property of Rochon crystal. When non-polarized natural light is incident vertically on the Rochon crystal prism, the light will be decomposed into two polarized lights with mutually perpendicular vibration directions, namely ordinary light (o light) and extraordinary light (e light). Rochon crystal polarizer is usually made of two negative uniaxial crystal prisms with mutually perpendicular optical axes (or parallel, according to different designs and application requirements) through a gluing process. These crystals can be high-quality optical materials such as γ -BBO, calcite, magnesium fluoride single crystal (MgF₂). Rochon crystal polarizer has the characteristics of high extinction ratio, wide band coverage, high precision and solid structure, and is widely used in scientific research, optical instrument manufacturing and communication technology.

The global Rochon Crystal Polarizer market size was estimated at USD 356.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
