Abstracts

Rock emulsion explosives are a class of industrial explosives characterized by a water-in-oil emulsion matrix, where microscopic droplets of an oxidizer-saturated aqueous solution are dispersed within a fuel-rich continuous oil phase. These explosives are distinguished by their high water resistance, stability, and relative safety in handling compared to traditional dynamites, as they are typically non-cap-sensitive until sensitized?often through the introduction of chemical sensitizers or microballoons?to become detonable. They are primarily used in mining, quarrying, and large-scale civil engineering projects for rock fragmentation due to their ability to maintain performance in wet conditions, their high velocity of detonation, and their customizable energy output based on formulation. The product falls within the broader category of bulk explosives, often manufactured on-site or delivered in bulk transport vehicles for direct pumping into boreholes, optimizing efficiency and reducing manual handling risks.

The global Rock Emulsion Explosives market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
