Report Overview:

Rogue Base Station (RBS), also known as IMSI Catcher (an international mobile subscriber identity-catcher), refers to a type of electronic surveillance equipment that collects information about nearby mobile devices. This is done either passively, by intercepting the radio signals already being transmitted between a mobile device (such as a mobile phone) and a mobile base-station (cell tower); or actively, by presenting itself to nearby mobile communication devices as a legitimate mobile base-station, thereby fooling devices to connect to the IMSI-catcher itself allowing further interception of information from the devices.

The purpose of an IMSI-catcher is to collect certain information about nearby devices such as the 'IMSI-number' identifying the device, its operator, and its subscriber. In the case of active IMSI-catchers, it may also gather information about communication taking place from the devices. The specific range and capabilities of IMSI-catchers depend on the model being used and the portability also varies, from models fitting in a briefcase to models intended for installation in cars, planes or drones. The capability of some more advanced IMSI-catchers allows law enforcement agencies (and others with access to the equipment) to identify nearby mobile devices (within a distance of roughly 200 m to 2 km depending on the portability of the IMSI-catcher), thereby possibly establishing the proximity of their associated owners, locate the devices with relative precision, gather communication metadata from those same mobile devices when they are used for communication, and block communication originating from the device. Some models, sometimes referred to as 'DRTboxes' or 'Dirtboxes' also enables interception of the content of communication originating from the mobile device.

The Global Rogue Base Station (RBS) Market Size was estimated at USD 116.45 million in 2023 and is projected to reach USD 221.36 million by 2029, exhibiting a CAGR of 11.30% during the forecast period.
