Report Overview

Roll coating machines are commonly used for the industrial application of a liquid to the surface of a part. Rollcoaters can be used to apply liquid adhesives, paints, oils, and coatings such as varnish or clear finish coats. Rollcoaters can take many forms, from simple paint rollers to sophisticated coating machines with multiple rollers. A roll coating machine works by transferring a layer of coating from the surface of a roller to the surface of a part. When this happens, a phenomenon known as “film splitting” occurs. The layer of coating on the surface of the roll splits – part of it stays on the roller, and part sticks to the surface of the part. The percentage of coating that sticks to the part (the substrate) depends on the surface characteristics of both the roller and the substrate.
