Report Overview

Rolling lubricants are mainly used to cool the metal and work rolls whilst providing the required lubrication to the roll and protecting both from corrosion. Rolling lubricants can be classified depending on type of rolling as: hot rolling lubricants and cold rolling lubricants. In hot rolling process the material is heated by an external heat at high temperature and then flattened while in cold rolling the material is rolled and flattened at or near to room temperature. Hot rolled materials require comparative less processing than cold rolled materials; however cold rolling is used more commonly due to which cold rolling lubricants hold prominent share in rolling lubricants market. The rolling lubricants can be added directly or in mixture with water, such as an emulsion depending on the application. In hot rolling, generally emulsions of rolling lubricants and water is used. During the rolling process, lubrication and thermal control is achieved by spraying emulsions onto the controlled part. In manufacturing of the rolling lubricants, additives such as lubricity improvers, antioxidants, emulsifiers, corrosion inhibitors and others are also added to improve its performance.
