Abstracts

The rolling mill coupling is a mechanical connection device used in the rolling mill transmission system, which can transmit power from the motor or reducer to the roller to achieve stable operation of the rolling mill. While transmitting torque, it also needs to absorb or compensate for the displacement caused by axial, radial and angular errors to reduce vibration and mechanical stress and extend the service life of the equipment. Common types of rolling mill couplings include gear couplings, diaphragm couplings and slider couplings, which are suitable for different working conditions and load requirements.

The global Rolling Mill Coupling market size was estimated at USD 162.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 2.90% during the forecast period.
