Report Overview

Rolling piston compressors are used for small capacity applications of up to 2 kW, such as domestic air conditioners and refrigerators. These compressors are included in the class of positive displacement compressors. Rolling piston compressors perform compression by reducing the volume of refrigerant. In this compressors rotating shaft of the compressor is eccentric with the rotor and its axis of rotation matches with centerline of the cylinder. The rotating motion of the roller creates reciprocation of the single vane which is positioned in non-rotating cylindrical block. The eccentricity of the shaft with reference to the roller enables suction and compression of the refrigerant. Rolling piston compressors are also called as fixed vane compressors.

Rolling piston compressors can function in any orientation in correspondence with gravitational field and acceleration or even in absence of acceleration and gravitation. Rolling piston compressors are compact in size, provide better performance, higher efficiency, and less weight than prior compressors. Increasing need for energy efficient compressors with minimum operation cost and less maintenance requirement is creating an escalation in demand for rolling piston compressors in the forecast period.
