Abstracts

The basic principle on which a rotary cup burner operates is the mechanical breaking of fuel into very fine particles. As the name suggests, this burner has a high-speed rotating cup operating at 5000 to 6000 rpm, depending on the burner manufacturer's design, and oil is made to pass over it in the form of a thin film. As a result of the high-speed rotary motion, the fuel particles get thrown away from the center of the cup in particular geometry and as a result, break into very fine particles. These particles when atomizing in different directions form a conical shape which is ignited to burn the fuel. Rotary cup burners are widely used in industrial boilers and heating furnaces, smelting and heat treatment in the metallurgical industry, cogeneration systems, commercial kitchens and food processing equipment, environmentally friendly waste incineration facilities, and heating and reaction processes in chemical production. With its efficient and stable combustion performance, it meets a variety of thermal energy needs.
