Abstracts

A rotary motion feedthrough is a specialized mechanical device designed to transmit rotational motion from an external drive source into a sealed environment?most commonly a vacuum or controlled atmosphere chamber?while maintaining the integrity of the enclosure?s pressure or gas composition. It typically consists of a rotating shaft sealed with bearings, magnetic couplings, or bellows to prevent leakage, and is engineered to handle factors such as torque, speed, vacuum compatibility, and thermal stability. These components are critical in applications where motion must be introduced into isolated systems without compromising environmental conditions, making them essential in sectors like semiconductor manufacturing, analytical instrumentation, aerospace testing, and research laboratories.

The global Rotary Motion Feedthroughs market size was estimated at USD 150.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
