Abstracts

A rotary waveguide attenuator is a precision passive microwave component designed to control the power level of electromagnetic signals propagating within a waveguide system by introducing a calibrated, variable amount of attenuation. It operates on the principle of rotating a lossy element, such as a vane or resistive card, within the waveguide to gradually obstruct the signal path, thereby reducing its amplitude without significantly affecting phase or introducing substantial reflection. Typically constructed from high-quality materials like aluminum or brass with precisely machined components to ensure minimal insertion loss and high power handling, these devices are characterized by their accuracy, repeatability, and ability to maintain impedance matching across a specified frequency range, making them essential in applications requiring precise signal level management, such as in test and measurement setups, radar systems, and communication networks.

The global Rotary Waveguide Attenuator market size was estimated at USD 118.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
