Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Rotating Grid Stabilizer competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, approximately 14 new rotating grid stabilizers were put into operation globally, with an average total cost of US\$24 million to US\$52 million per unit (including the rotating main unit, excitation system, transformer, filter, civil engineering, and grid connection). The industry's average gross profit margin was between 17% and 24%. A rotating stabilizer is a type of grid dynamic stabilization device that uses a synchronous motor as its core and provides short-circuit capacity, transient stability, rapid reactive power regulation (Q), and voltage support through a high-speed, high-inertia rotor. Typical inertia constants are 3-12 s, with rated capacities of 80-350 MVar. It can be configured with flywheel modules (increasing the inertia coefficient by 1.5-3 times). Its grid connection point is typically located at the 220-500kV main transformer bus, used to mitigate the risks of inertia loss, low short-circuit ratio (SCR), and voltage collapse caused by high-proportion wind and solar power integration. In the core cost structure of the equipment, rotor forgings and large high-permeability stator and rotor silicon steel sheets account for approximately 28%-34%; excitation systems and static var compensator control modules account for 19%-26%; high-voltage transformers and filters account for 18%-22%; and civil engineering and grid connection costs account for 25%-32%.

The global Rotating Grid Stabilizer market size was estimated at USD 529.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 14.10% during the forecast period.
