Abstracts

A rotating sludge scraper is a mechanical device used in wastewater treatment facilities, specifically in circular sedimentation tanks or clarifiers, to continuously remove settled solids (sludge) from the tank bottom. It consists of a central drive unit mounted on a bridge or pier structure, with radial arms extending to the tank walls; these arms are equipped with blades or scrapers that slowly rotate, pushing accumulated sludge toward a central hopper for withdrawal. The system is essential for maintaining tank efficiency, preventing sludge buildup that could hinder sedimentation, reduce treatment capacity, or cause operational issues. Designs may vary in material composition, drive mechanisms (e.g., hydraulic, electric), and blade configurations to accommodate different tank sizes, sludge characteristics, and operational requirements, ensuring effective solid-liquid separation in municipal and industrial water treatment processes.

The global Rotating Sludge Scraper market size was estimated at USD 124.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.75% during the forecast period.
