Abstracts

A rotational friction damper is a mechanical device designed to dissipate kinetic energy through controlled frictional resistance between rotating components, typically consisting of a rotor, friction surfaces, and an adjustable clamping mechanism that regulates torque transfer and energy absorption. It functions by converting rotational motion into heat via sliding friction, providing precise, velocity-dependent damping without reliance on hydraulic fluids or complex seals, making it suitable for applications requiring consistent performance, minimal maintenance, and resistance to environmental extremes. These dampers are engineered to offer tunable damping characteristics, allowing customization for specific torque and energy dissipation requirements in systems where rotational vibration, shock absorption, or motion control is critical.

The global Rotational Friction Damper market size was estimated at USD 125.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.25% during the forecast period.
