Abstracts

Rotational Thrombectomy System is a minimally invasive medical device used to remove blood clots in blood vessels. It uses a high-speed rotating mechanism to break up the clot and suck it out, thus restoring the blood vessels. The system usually consists of a rotary drive unit, a guide wire, and a catheter connected to an external collection bag. The rotary drive unit causes a spiral or basket device inside the catheter to rotate at high speed, creating a hydraulic vortex that breaks up the clot and draws it into the catheter, and then transports the broken clot to an external collection bag via negative pressure, thus avoiding distal embolization of the clot fragments.

The global Rotational Thrombectomy System market size was estimated at USD 446.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 13.60% during the forecast period.
