Report Overview:

Rotogravure Printing Plate Cylinders are plates used in the gravure printing process. In gravure the printing form is typically a steel cylinder with a thin copper coating applied by electroplating. The vast majority of gravure presses print on rolls (also known as webs) of paper or other substrates, rather than sheets.

Gravure printing is the opposite of relief printing, in that the printing is done from ink that is below the surface of the plate. The design is cut, scratched, or etched into the printing surface or plate, which can be copper, zinc, aluminum, magnesium, plastics, or even coated paper. The printing ink is rubbed into the incisions or grooves, and the surface is wiped clean. Unlike surface printing, gravure printing—which is actually a process of embossing the paper into the incised lines—requires considerable pressure.

Like engraving, gravure is a form of intaglio printing that produces fine, detailed images. Like flexography, gravure printing is often used for high-volume printing of packaging, wallpaper and gift wrap. Although less common, gravure printing may also be used for printing magazines, greeting cards, and high-volume advertising pieces.

The Global Rotogravure Printing Plate Cylinder Market Size was estimated at USD 859.82 million in 2023 and is projected to reach USD 1075.45 million by 2029, exhibiting a CAGR of 3.80% during the forecast period.
