## Abstracts

Rotor balancing service is a professional technical service for rotor components in rotating machinery. It aims to adjust the mass distribution of the rotor through specific processes and equipment so that it can reach a balanced state during rotation, thereby reducing vibration, reducing noise, improving equipment operation efficiency and reliability, and extending equipment service life. When the rotor is rotating, if the mass distribution is uneven, unbalanced force will be generated, causing equipment vibration. Excessive vibration will not only affect the normal operation of the equipment, but may also cause damage to equipment components and even cause safety accidents. Through rotor balancing service, the vibration amplitude can be effectively reduced, making the equipment run more smoothly. Unbalanced rotors will generate periodic impact forces during rotation, thereby generating noise. After achieving rotor balancing, this impact force can be reduced, thereby reducing the noise during equipment operation and improving the working environment.

The global Rotor Balancing Service market size was estimated at USD 643.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
