Abstracts

An ROV (Remotely Operated Vehicle) moonpool handling system is a specialized setup that enables efficient deployment and retrieval of ROVs. A moonpool is a vertical shaft or opening on a vessel, and this handling system is designed to work in tandem with it. It typically consists of a winch system with strong cables to lower and raise the ROV precisely through the moonpool. The system is engineered to ensure smooth operations, even in rough sea conditions. This is crucial as it allows for easy access to the underwater environment from the vessel without the need for more complex and exposed side - launching procedures. The ROV moonpool handling system also includes guidance mechanisms to keep the ROV stable during its journey in and out of the water. This reduces the risk of damage to the ROV and the vessel, and it improves the overall effectiveness of underwater operations such as ocean exploration, offshore infrastructure inspection, and scientific research.

The global ROV Moonpool Handling System market size was estimated at USD 311.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.30% during the forecast period.
