## Abstracts

Rubber urinary catheters are medical devices inserted into the bladder through the urethra to drain urine, typically used in cases of urinary retention, incontinence, surgical procedures, or for patients with neurological conditions affecting bladder function. Historically made from natural latex rubber, these catheters are valued for their flexibility, cost-effectiveness, and ease of use, though they have been largely supplemented or replaced in many clinical settings by silicone or hydrogel-coated alternatives due to concerns over latex allergies, biofilm formation, and patient comfort. The market for rubber urinary catheters persists primarily in resource-limited environments and certain niche applications where low cost and availability outweigh the drawbacks associated with material limitations.

The global Rubber Urinary Catheter market size was estimated at USD 1850.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.75% during the forecast period.
