Report Overview

Rubidium oscillators are one of the most precise time standards known to the electronics world. As a basic unit, a rubidium clock is nothing but a crystal oscillator locked to an atomic reference. One part of the rubidium oscillator is a high-quality quartz crystal-based oven-controlled oscillator (OCXO), which creates the output signal, while another part is the rubidium “physics-package”, that provides the timing accuracy to control the OCXO frequency. Any Rubidium oscillator is prepared with high degree of stability, this guarantees a greater hold-over period during the unavailability of an input references. Greater hold-over period in turn accounts for a product to offer precise and optimum time stamps. Therefore, maintaining a 10 MHz output for a longer period of time once the oscillator has lost the time synchronization.
