### Report Overview:

Ruled diffraction gratings are optical devices used to disperse light into its component colors or wavelengths by means of diffraction. They are essential components in spectroscopy, where they are used to analyze the spectrum of light emitted or transmitted by a sample. Ruled diffraction gratings are a type of optical grating that consist of a surface with closely spaced parallel grooves or rulings.

The basic principle behind ruled diffraction gratings is based on the phenomenon of diffraction, where light waves encounter obstacles or slits that are on the order of the wavelength of light. When light passes through or reflects off the rulings on a grating, it undergoes constructive and destructive interference, resulting in the separation of different wavelengths of light into discrete orders or spectral lines.

The Global Ruled Diffraction Gratings Market Size was estimated at USD 147.36 million in 2023 and is projected to reach USD 190.80 million by 2029, exhibiting a CAGR of 4.40% during the forecast period.
