Abstracts

Rumen Protected Fat (RPF) refers to a type of dietary fat specifically designed for ruminant animals, such as cows, sheep, and goats, to bypass the rumen—the first compartment of their stomach—and be absorbed in the small intestine. In ruminants, the rumen hosts microorganisms that break down feed but also degrade normal dietary fats, which can disrupt digestion and reduce feed efficiency. RPF is coated or formulated to resist microbial breakdown in the rumen, ensuring it reaches the small intestine intact. This approach provides a concentrated source of energy without interfering with rumen fermentation, supporting better productivity, milk yield, and overall animal health.

The global Rumen Protected Fat market size was estimated at USD 892.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.40% during the forecast period.
