### Report Overview

Ruthenium is a lustrous silver metal that is impervious to air, water and acids, but is soluble in molten alkali. Extraction of metals is achieved by several techniques; for example, extraction of mixed platinum group metals by dissolution in aqua regia, followed by processing of various soluble and insoluble fractions. Metals have limited applications; as a pure metal, ruthenium is very hard and brittle, making it difficult to machine. It is relatively inactive and is used as an alloying element, together with platinum and palladium to produce alloys that improve wear resistance, and together with titanium to improve the corrosion resistance of materials. Ruthenium foils are presented in flakes as pure metal and metal alloy flakes. Ruthenium foil has a high melting point and good corrosion and chemical resistance. Due to their fragile nature, some foils are coated with acrylic or polyester support on one side.
