Report Overview

Ruthenium(III) Chloride Hydrate is a highly insoluble thermally stable Ruthenium source suitable for glass, optic and ceramic applications. Chloride compounds can conduct electricity when fused or dissolved in water. Chloride materials can be decomposed by electrolysis to chlorine gas and the metal. They are formed through various chlorination processes whereby at least one chlorine anion (Cl-) is covalently bonded to the relevant metal or cation. Ultra high purity and proprietary formulations can be prepared. The chloride ion controls fluid equilibrium and pH levels in metabolic systems. They can form either inorganic or organic compounds. Ruthenium(III) Chloride Hydrate is generally immediately available in most volumes. Ultra high purity and high purity compositions improve both optical quality and usefulness as scientific standards. Nanoscale elemental powders and suspensions, as alternative high surface area forms, may be considered.

The global Ruthenium(III) Chloride Hydrate market size was estimated at USD 85.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
