## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on SAC Exchange Resin competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global SAC Exchange Resin production reached approximately 394 kilotons with an average global market price of around US\$ 2,000 per ton, a single-line production capacity of approximately 2,000 tons/year, and a gross profit margin of approximately 10%-30%. SAC (Strong Acid Cation) Exchange Resin is a highly cross-linked, insoluble polymeric resin that contains strong acidic functional groups typically sulfonic acid ( $\text{-SO}_3\text{H}$ ) anchored onto a styrene-divinylbenzene or acrylic polymer matrix. These resins possess high ion-exchange capacity and remain fully ionized across a wide pH range, enabling them to efficiently exchange cations such as calcium ( $\text{Ca}^{2+}$ ), magnesium ( $\text{Mg}^{2+}$ ), sodium ( $\text{Na}^+$ ), and heavy-metal ions with hydrogen ( $\text{H}^+$ ) or other counter-ions. SAC resins are widely used for water softening, demineralization, condensate polishing, industrial water treatment, hydrometallurgy, food processing, and chemical purification processes. Their strong acidity gives them excellent thermal stability, oxidative resistance, and consistent performance under high ionic load and fluctuating operating conditions.

The global SAC Exchange Resin market size was estimated at USD 789.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
