Abstracts

The saccule dilation catheter is a specialized medical device designed for minimally invasive procedures, typically within the fields of urology and gastroenterology, where it is used to dilate or expand narrow or obstructed passageways such as the urethra, esophagus, or other tubular structures. This catheter features an inflatable balloon at its distal end, which can be precisely controlled to apply radial force and mechanically widen strictures or facilitate stent placement, offering an alternative to more invasive surgical interventions. Its design often incorporates materials like medical-grade polymers for flexibility and biocompatibility, radiopaque markers for accurate positioning under imaging guidance, and a dual- or triple-lumen configuration to allow for inflation, irrigation, or guidewire passage, making it a critical tool in improving patient outcomes through reduced trauma, shorter recovery times, and enhanced procedural precision.

The global Saccule Dilation Catheter market size was estimated at USD 125.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.
