Report Overview

Safety interlock switches respond when a mechanical guard opens. Interlock switches feature 'positive opening' contacts for high reliability regardless of environmental conditions and withstand attempts to override the switch and defeat the system. Noncontact safety interlock switches are machine safety products that provide a compact, non-contact way to interlock doors, guards, gates, and covers. The switch can be tripped by a simple action such as opening a door. Tripping the switch can turn a machine off, preventing damage to both a human operator and the machine.
