Report Overview

Safety return valve is a valve to protect the system from damage due to high pressure. Once the medium pressure in the system pipeline or device exceeds the set value, it will automatically release the pressure, so as to achieve the purpose of safety protection. There are two types of safety return valves: spring type and rod type. In addition, there are impulse safety valve, pilot safety valve, safety switching valve, safety decompression valve, static weight safety valve, etc. Spring type safety valve mainly depends on the force of spring. There are closed and non closed spring type safety valves. Generally, the closed type shall be selected for flammable, explosive or toxic media, and the non closed type can be selected for steam or inert gas. In the spring type safety valve, there are also those with wrench and without wrench. The wrench is mainly used to check the flexibility of the valve disc. Sometimes it can also be used for manual emergency pressure relief. Lever type safety valve mainly depends on the force of lever hammer, but the large volume of lever type safety valve often limits the selection range. When the temperature is high, the safety valve with radiator shall be selected.
