### Report Overview:

A storage area network (SAN) switch is a device that connects servers and shared pools of storage devices and is dedicated to moving storage traffic. The SAN switch contains the Director-class switches and Fibre Channel switches.

A SAN switch is often a Fibre Channel (FC) switch, which is compatible with the Fibre Channel protocol. The FC switch checks the data packet header, determines the computing devices of origin and destination, and sends the packet to the intended storage system. An FC switch is designed for use in a high-performance network with low latency and lossless data transmission.

A SAN fabric switch contains a low to medium port count, while a director is a high port count switch (generally above 64 ports). Fibre Channel switches can be networked together to build larger storage networks. The HBA is more complex than a traditional Ethernet card.

The Global SAN Switches Market Size was estimated at USD 1709.98 million in 2023 and is projected to reach USD 1514.77 million by 2029, exhibiting a CAGR of -2.00% during the forecast period.
