Abstracts

Sand-based permeable bricks use wind-deposited sand as raw material and have water permeability by destroying the surface tension of water. There are a large number of capillaries in the brick body with pores smaller than the diameter of dust, which can not only permeate water but also play a filtration and purification role. When the service life of the sand-based permeable bricks expires, only a small amount of energy is consumed to turn the old bricks into sand and then make new bricks, which is green and environmentally friendly.

The global Sand-based Permeable Brick market size was estimated at USD 107.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.70% during the forecast period.
