Report Overview:

The principle of a vacuum valve is that when a negative pressure is generated in the system, the pressure difference between atmospheric pressure and system pressure acts on the sealing element, pushing the sealing element of the vacuum valve, opening the sealing surface to introduce the external atmosphere into the system, causing the system pressure to rise and destroy the negative pressure. Until the vacuum valve sealing element falls back down and seals again, the external atmosphere no longer enters the system. When the system is under positive pressure, the working medium enters the upper part of the sealing element, and the sealing element is pressed down. The higher the system pressure, the tighter the seal, Ensure that the vacuum valve does not leak during positive pressure. The product is suitable for industries such as beer, beverages, dairy products, edible oils, biology, pharmaceuticals, textiles, chemicals, etc
