Report Overview:

Communication satellites can be divided into low orbit satellites (LEO), medium orbit satellites (MEO) and geosynchronous orbit satellites (GEO). Compared with medium orbit satellites (MEO) and geosynchronous orbit satellites (GEO), low orbit satellites (LEO) is about 160 to 2,000 kilometers from the height of the earth, which is relatively low, making the transmission delay short. Satellite Communication Phased Array Antenna plays a vital role during this process. The satellite communication phased array antenna is antenna arrays that have the unique ability to change the shape and direction of the radiation pattern without physically moving the antenna. The satellite communication phased array antenna is composed of multiple antenna units. By changing the phase and amplitude of the signal transmitted by each antenna unit channel and changing the aperture illumination function of the phased array antenna, the fast scanning and shape change of the antenna beam can be realized. Elements in an antenna array are placed in such a way that the signals transmitted by individual antennas sum up and provide better gain, directivity and performance in a particular direction.

The Global Satellite Communication Phased Array Antenna Market Size was estimated at USD 575.60 million in 2023 and is projected to reach USD 9987.43 million by 2029, exhibiting a CAGR of 60.90% during the forecast period.
