Abstracts

Optical Ground Stations are used for laser communications with satellites in various Earth orbits (GEO, MEO, LEO) or to planets. Depending on user requirements and telescope size such station can either be stationary or transportable. Optical communication to satellites has the potential to offer much higher speed communication with enhanced security over current radio-frequency systems. Optical lasers also have a much lower beam divergence when propagating compared to radio frequencies. This allows for longer distance transmission and prevents interference between different optical communication sources, even over large distances. The lack of interference means that optical communication is inherently more secure than RF communication.

The global Satellite Optical Ground Station market size was estimated at USD 4987.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
