Abstracts

Satellite Rideshare Launch Service is a commercial launch model that uses a single launch vehicle to transport multiple small or microsattellites from different customers to a predetermined orbit. Through professional mission management, this service integrates, adapts, and coordinates the deployment of satellites of different specifications and missions within the fairing, effectively distributing high launch costs and allowing individual customers to access space at a significantly lower cost than dedicated launches. Its core value lies in integrating fragmented small satellite launch needs to create economies of scale. This not only significantly lowers the barrier to entry into space but also significantly improves launch frequency and mission flexibility through standardized interfaces and modular payload solutions. This model has become a core infrastructure driving the rapid deployment of global low-Earth orbit communication constellations, remote sensing constellations, and technology verification constellations, and has spawned a new one-stop aerospace service ecosystem focused on consolidation, orbit tracking and control, and on-orbit delivery. Satellite Rideshare Launch Service is experiencing explosive growth in demand. Currently, the global low-Earth orbit (LEO) communication and remote sensing constellations are entering a period of intensive deployment, generating a massive demand for small and medium-sized satellite launches. Traditional dedicated launch models are costly and time-consuming, failing to meet the requirements for efficient network deployment. Shared launches, through a "space pooling" model, distribute the cost of a single launch among multiple customers, reducing launch costs by up to 50%. This creates a multi-billion dollar market opportunity for launch service providers to integrate fragmented demands and achieve high-frequency, large-scale operations. It also fosters emerging value-added service areas such as orbital slot coordination, interface standardization, and on-orbit deployment management, becoming the most certain growth track in commercial spaceflight. The cost structure of Satellite Rideshare Launch Service centers on rocket

manufacturing costs and launch operation expenses. The rocket body, engine, and guidance system constitute the main hardware costs, while launch site usage, telemetry, tracking, and command (TT&C) networks, and insurance represent significant operating expenses. The core driver of this business's gross profit margin lies in maximizing capacity utilization through high-density consolidation, thereby effectively amortizing fixed costs. Its gross profit margin exhibits typical economies of scale: the gross profit margin for a single launch mission is limited, but as the number of consolidated satellites increases, launch frequency rises, and rocket reusability technology matures, the gross profit margin can be rapidly optimized to over 20%. Profitability directly depends on consolidation capabilities, launch frequency, and supply chain cost control. Leading companies can establish a continuously optimized profit structure through standardized interfaces and high-frequency missions.

The global Satellite Rideshare Launch Service market size was estimated at USD 1080.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.40% during the forecast period.
