Abstracts

Spacecraft that orbit Earth, called satellites, are close enough to the Sun that they can often use solar power. These spacecraft have solar panels which convert the Sun's energy into electricity that powers the spacecraft. The electricity from the solar panels charges a battery in the spacecraft. These batteries can power the spacecraft even when it moves out of direct sunlight. In this report, satellite solar panels include solar panels and arrays for satellite. Solar panels & arrays are constructed from individual solar cells connected in series to form strings and in parallel to form circuits mounted on a substrate backing. While very low power CubeSats and SmallSats may only need body-mounted solar panels, most will require more power from deployed solar arrays. The deployed solar arrays for CubeSats and SmallSats are mostly on rigid substrates made of either a Printed Circuit Board (PCB), Composite Fiber Reinforced Panels (CFRPs), or an aluminum honeycomb panel. Deployed solar arrays are often the largest structure on a satellite; the ratio between the size of the deployed solar array and the size of the SmallSat may be much higher compared to other conventionally large spacecraft. The size and fundamental frequency of the solar arrays impact spacecraft pointing, propulsion, and delta-V needed for station keeping. Important considerations for SmallSat solar arrays are: deployment mechanisms, deployed frequency, panel specific power, and power density, as well as stowed volume. Most of these metrics are not listed on manufacturer's data sheets. Solar array comparison can be challenging because SmallSat/CubeSat manufacturers who make solar arrays specific to their bus and payload designs often do not report solar array power using the same metrics. Their reported 'power' can mean multiple things: power available to the payload, peak power provided by a combination of solar array and battery, or an orbital specific average power. Solar array power (Peak BOL) reported in the chart is mainly referring to the peak power of the solar array at the beginning of life, 28°C which is mission-independent. Panel stiffness and moment of inertia are dependent on multiple factors

such as size and mass of the panel as well as spacecraft size and weight distribution, and usually need to be calculated for a specific spacecraft. Global key players of Satellite Solar Panel include Spectrolab and Rocket Lab, etc. The top two players hold a share about 55%. North America is the largest market, has a share about 58%. In terms of product type, Multi-junction Solar Cells is the largest segment, occupied for a share of about 93%, and in terms of application, Large Satellite has a share about 75 percent.

The global Satellite Solar Panel market size was estimated at USD 1718.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.90% during the forecast period.
