Abstracts

Saturated polyester resin refers to a class of synthetic thermosetting polymers derived from polyhydric alcohols and polybasic acids, characterized by the absence of reactive double bonds in their molecular backbone, which distinguishes them from unsaturated polyester resins. These resins are typically supplied as solid or high-viscosity solutions and require cross-linking agents such as amino resins (e.g., melamine or urea formaldehyde) or polyisocyanates to cure into durable, chemically resistant, and mechanically robust coatings, adhesives, or composite matrices. Key properties include excellent weatherability, adhesion, flexibility, and resistance to solvents, chemicals, and abrasion, making them suitable for high-performance applications like automotive coatings, coil coatings, industrial finishes, can and container linings, and electrical insulation. Their formulation can be tailored to achieve specific characteristics such as hardness, gloss, or thermal stability, often enhanced through modifications with other resins or additives to meet stringent industrial and regulatory standards.

The global Saturated Polyester Resin market size was estimated at USD 1315.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.65% during the forecast period.
