Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on SBA Ion Exchange Resin competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global SBA Ion Exchange Resin production reached approximately 210 kilotons, with an average global market price of around US\$ 2,000 per ton, a single-line production capacity of approximately 2,000 tons/year, and a gross profit margin of approximately 20%-40%. SBA (Strong Basic Anion) Ion exchange resin is an insoluble, bead-shaped polymer material that carries strongly basic quaternary ammonium functional groups, which can completely dissociate across a wide pH range and reversibly exchange anions with those present in water (such as Cl⁻, SO₄²⁻, NO₃⁻, HCO₃⁻, SiO₄⁴⁻). Built on a cross-linked organic matrix, typically styrene-divinylbenzene or an acrylic backbone, SBA resins are usually operated in the chloride or hydroxide form and are capable of removing both strong-acid anions and, in suitable configurations, weakly dissociated species like silica and CO₂. Because their functional groups are “strong base”, they remain ionized even at low temperatures and low pH, giving them broad operating ranges and high affinity for many anions. The value chain for SBA (Strong Base Anion) ion exchange resin runs from petrochemical and specialty-chemical suppliers upstream, through resin manufacturers and system integrators in the midstream, to water-treatment OEMs and end-user industries downstream. Upstream, key inputs are styrene or other vinyl monomers, crosslinkers such as divinylbenzene (DVB), porogens and polymerization initiators used to form the polystyrene-DVB matrix, together with chloromethylating agents and a range of tertiary amines (e.g. trimethylamine, dimethylethanolamine) that are used to functionalize the polymer into type I or type II strong base anion groups. Midstream, ion exchange resin producers carry out bead polymerization, crosslinking, sulfo-/chloromethylation and

amination to produce SBA resins with specific porosity, crosslink density, particle size distribution and moisture content; they then classify, wash, convert to defined ionic forms (Cl⁻, OH⁻, mixed) and package the resin. At this stage, manufacturers develop product families tailored for power-plant demineralization, condensate polishing, ultrapure water, condensate amine removal, organic scavenging or food and pharma processing, and often provide technical support, performance data and regeneration guidelines. Downstream, engineering firms and OEMs design, build and operate demineralization, condensate polishing, EDI pretreatment and specialty separation systems for power generation, microelectronics, pharmaceuticals, chemicals, food and beverage, municipal and industrial water treatment, using SBA resins as the main anion-exchange medium. Further downstream, plant operators manage resin operation, regeneration, monitoring and eventual replacement, while service companies offer on-site resin change-outs, off-site regeneration, performance audits and waste-resin handling in line with environmental regulations.

The global SBA Ion Exchange Resin market size was estimated at USD 416.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.20% during the forecast period.
