Abstracts

SBR, or Styrene-Butadiene Rubber, is a type of synthetic rubber that is widely used as a binder in various applications, including lithium-ion batteries. In the context of battery manufacturing, SBR binders are particularly known for their excellent viscoelastic properties and dispersion characteristics, which make them suitable for binding active materials in the negative electrode (anode) of lithium-ion batteries. PAA, or Polyacrylic Acid, is a water-soluble polymer that has recently gained attention as a high-performance binder for silicon-based negative electrodes in lithium-ion batteries. Silicon-based materials offer significantly higher capacity than graphite, making them attractive for use in high-energy-density batteries. However, the high volume expansion of silicon during charging and discharging poses challenges for binder performance. SBR and PAA binders play crucial roles in the performance of lithium-ion batteries. SBR binders are widely used in graphite-based negative electrodes for their viscoelastic properties and dispersion characteristics, while PAA binders offer high adhesion strength and the ability to form a stable SEI layer, making them ideal for silicon-based negative electrodes. The choice of binder depends on the specific application and the requirements for battery performance.

The global SBR and PAA Binders market size was estimated at USD 862.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.90% during the forecast period.
