Report Overview

Scaffold-free 3D stem cell culture is a technique used to grow stem cells in three-dimensional structures without the use of supporting scaffolds or matrices. In this method, stem cells are encouraged to self-assemble and form spheroids or organoids, which more accurately mimic the natural environment and architecture of tissues within the body. This approach allows for improved cell-cell interactions, better mimicking in vivo conditions, and is beneficial for studying cell behavior, drug testing, and tissue engineering. Scaffold-free 3D cultures can be achieved through various methods such as hanging drop, low-adhesion plates, and rotating bioreactors.
