Abstracts

Scanning Acoustic Microscopy (SAM) is a non-destructive imaging technique that uses high-frequency sound waves (ultrasound) to visualize the internal structures of materials at a microscopic level. The method involves scanning a specimen with ultrasonic waves, and the resulting reflections are analyzed to create detailed images of features like voids, cracks, delaminations, and material inconsistencies. SAM is particularly useful in inspecting microelectronics, semiconductor devices, and composite materials, as it provides high-resolution, 3D images of the internal structure without damaging the sample. This technique is valuable for quality control, failure analysis, and research in various industries such as electronics, aerospace, and materials science.

The global Scanning Acoustic Microscopy Sam market size was estimated at USD 149.67 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.70% during the forecast period.
