Abstracts

Scanning Auger Nanoprobe is an advanced instrument for surface analysis of materials using the principle of Auger Electron Spectroscopy (AES). It excites the surface of the sample by focusing the electron beam to produce auger electrons, so as to obtain qualitative or quantitative information of the element composition (part of the chemical state) on the surface of the material. With nanoscale spatial resolution, it can observe the nanoscale morphology and characterize the composition. It is widely used in materials science, semiconductor industry, chemical engineering and other fields. It provides strong support for the study of chemical composition and element distribution on solid surface.

The global ?Scanning Auger Nanoprobe market size was estimated at USD 602.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
