Abstracts

A Schottky Barrier Diode (SBD) is a semiconductor device formed by the junction of a metal and a semiconductor material, typically n-type silicon or gallium arsenide, which creates a Schottky barrier—a potential energy barrier for electrons at the interface. Unlike conventional p-n junction diodes, Schottky diodes exhibit a lower forward voltage drop (typically 0.2–0.3 V compared to 0.6–0.7 V for silicon diodes) and faster switching speeds due to the absence of minority carrier storage, making them highly efficient in high-frequency applications, power rectification, and clamping circuits. However, they generally have higher reverse leakage currents and lower maximum reverse voltage ratings, which limit their use in high-voltage environments. Their unique characteristics stem from the majority carrier operation, reducing recovery time and making them ideal for applications requiring minimal power loss and rapid response, such as in switch-mode power supplies, RF circuits, and solar cell bypass protection.

The global Schottky Barrier Diode market size was estimated at USD 1389.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.28% during the forecast period.
