Report Overview

The Selective Catalytic Reduction (SCR) system injects ammonia into the boiler flue gas and passes it through a catalyst bed where the ammonia and nitrogen oxide gas (NO_x) react to form nitrogen and water vapor. In this process, the NO_x reduction takes place as the flue gas passes through a catalyst chamber. Selective catalytic reduction is a post-combustion technology used in coal burning applications to reduce NO_x emissions. SCR systems ultimately reduce flue gas NO_x to N₂ and H₂O. This technology is the most efficient method of reducing NO_x emissions in the coal fired power plants where in efficiencies of about 70 to 90 percent are required.

Development of SCR technology continued in Japan and the US in the early 1960s with research focusing on less expensive and more durable catalyst agents. The first large-scale SCR was installed by the IHI Corporation in 1978.
