Report Overview

The Selective Catalytic Reduction (SCR) system injects ammonia into the boiler flue gas and passes it through a catalyst bed where the ammonia and nitrogen oxide gas (NO_x) react to form nitrogen and water vapor. In this process, the NO_x reduction takes place as the flue gas passes through a catalyst chamber. Selective catalytic reduction is a post-combustion technology used in coal burning applications to reduce NO_x emissions. SCR systems ultimately reduce flue gas NO_x to N₂ and H₂O. This technology is the most efficient method of reducing NO_x emissions in the coal fired power plants where in efficiencies of about 70 to 90 percent are required.
