Abstracts

Screen reading software for the visually impaired is an assistive technology tool designed specifically for visually impaired individuals. Through text-to-speech (TTS) or Braille output, it converts text, interface elements, and operation feedback on the screens of electronic devices such as computers and mobile phones into audible or tactile information in real time, helping users to use digital products and services independently and efficiently. The development of screen reading software for the visually impaired is driven by multiple factors, including the advancement of information accessibility legislation, the popularization of digital inclusion concepts, increased awareness of the rights of the visually impaired, and progress in artificial intelligence and speech synthesis technologies. Many countries worldwide have enacted mandatory accessibility regulations, requiring government websites, financial institutions, educational institutions, and other public services to be compatible with screen reader software. Simultaneously, the maturity of high-quality text-to-speech (TTS), AI image recognition, and semantic understanding technologies has enabled screen readers to move from mechanical reading to intelligent interpretation, significantly improving the user experience. Driven by both social equity demands and technological feasibility, screen reader software is transforming from a peripheral assistive tool into a core infrastructure for safeguarding the information access rights and social participation rights of the visually impaired in the digital age.

The global Screen Reading Software for Visually Impaired market size was estimated at USD 162.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
