Report Overview

A screw implant is an artificial tooth bracket used in dental implant surgery, and it is usually made of materials such as titanium alloy or zirconium alloy. The shape of the screw implant is similar to a threaded nail, with a threaded surface, which can better integrate with the alveolar bone and improve the stability and firmness of the implant. Screw implants are surgically inserted into the missing alveolar bone and gradually heal with the bone tissue. During the healing process, the screw implant fuses with the surrounding bone tissue to form a strong support structure that ultimately supports the denture or restoration. Screw implants are a common implant form with a wide range of applications and good long-term stability and reliability.
