Abstracts

Screws are used for internal fixation more often than any other type of implant. Although the screw is a simple device, there are different designs based on the type of fracture and how the screw will be used. Screws come in different sizes for use with bones of different sizes. Screws can be used alone to hold a fracture, as well as with plates, rods, or nails. After the bone heals, screws may be either left in place or removed. A significant driver in the Bone Fixation Screws market is the rising incidence of orthopedic injuries and the growing demand for minimally invasive surgical techniques. Bone fixation screws play a crucial role in stabilizing fractures and supporting bone healing, particularly in trauma cases. However, a notable challenge in this market is the need for material innovation and biocompatibility. Ensuring that bone fixation screws are made from biocompatible materials that promote bone integration and minimize the risk of complications poses a significant challenge. Manufacturers must invest in research and development to create advanced materials and design techniques that enhance the efficacy and safety of bone fixation screws, meeting the needs of orthopedic surgeons and patients seeking optimal outcomes in fracture management and orthopedic surgeries.

The global Screws for Bone Fixation market size was estimated at USD 1311.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.50% during the forecast period.
